A Guide to Composing for Orchestra
with Symbolic Composer

Over the past 9 months I have been developing an approach to composing orchestral music using Tonality Systems *Symbolic Composer.* I'm now half way through the composition of a sequence of orchestral concertos titled *Six Concertos (Instrumentarium Novum).*

This Guide is written for composers familiar with SCOM and attempts to present as much as possible from illustrations and code rather than wordy explanation.

The rationale for working in this way came from a desire to bring together the composition of the music to be played by an orchestra with the business of the selection of instruments, in other words the orchestration. Was it possible, through using a computer environment like SCOM, to bring these two activities together? I've tried within SCOM code to device a mode of rough prototyping. The aim: to enable the composer to experience some of the essential elements of the composition before turning to the working in small detail that tends to overwhelm orchestral composition.

It was from this aim that the idea of I-Functions was born. Essentially, I-Functions is a collection of on-the-fly functions belonging to a separate (customisable) file, that may be applied using a two letter abbreviation and placed on what I have called a Scoresheet. With this in place it becomes possible for the composer to apply very quickly a processing action.

In all the concertos the music starts life as a stream of vectors converted to symbols. The symbol stream is processed to find phase boundaries and then becomes a list of phrases. This list becomes the core pitch material of the music which is applied to a seven layer orchestration of timbres types. The incidence of play and silence across this seven layer orchestration is controlled by an array-generated timesheet into which the phrases are 'poured' using the <symbol-swallow> mechanism. Very quickly it is possible to hear an 'orchestra' (of seven timbres) play a heterophonic rough prototype of the music. At this point the composer begins building the Scoresheet, processing each phrase in each of the seven layers using the I-Functions. To make composing easier the code is assembled in a series of files initially kept open on the desktop, some as reference (like the Timesheet), others as executable windows of data. Working this way enables, generally, much faster compilation and debugging.

Once a second-stage prototyping is done the music leaves Symbolic Composer and is ready to be worked on in a scorewriter (in my case Nightingale which reads zone-lengths as time-signatures). All rhythm, most part-writing, the harmonic structure, the basic orchestration is in place. It is expanded over two stages: in eleven layers, then sixteen layers.

The examples included here show page 1 of the first Concerto from the rough prototype, through the I-Function Scoresheet processing, to the eleven layer version, to the final sixteen layer version.

1. Example 1 - first rough prototype. Output from SCOM

2. Example 2 - second prototype showing how I-functions have processed the material. Output from SCOM

3. Example 3 - working now in Nightingale. Score expanded to eleven layers

4. Finished Score - Page 1

5. I-Function Tester - a demo score showing I-functions processing a single phrase sequencially.

6. I-Function Tester Score - a notated and annotated output of the SCOM scorefile

7. A screen image showing how multiple windows are used to co-ordinate the process of the composition

8. The complete scorefile for Concerto 1, first movement

Nigel Morgan 29 September 2004

Concerto 1:1 (phrases 1 - 4)

Process of Pitch Composition

* Vector output from gen-noise-white
* conversion into Symbols (scaled between a l)
* division into Phrases (using create-lists)
* Phrases picked and randomised into new order
* new order includes possibility of Repeats

Orchestration

* Stage 1 orchestration in 7 timbres
* Wind 1 & 2, Brass, Strings 1 & 2, Percussion, Continuo
* Array-based processing of instrumentation possibilities
* Production of timesheet to display incidence of play and silence

Concerto 1:1 (phrases 1 - 4)

This example shows the effect of processing each part using I-Functions.

I-Functions used here are:
cl - change-length
fg / lr - symbol-figurate (plus length-repeat)
sh - symbol-harmonize
si - symbol-inversion (@ symbol g)
sk - symbol-skip
ct - symbol-cut
bs - symbol-bundle-i

Concerto 1:1 (phrases 1 - 4)

for Susan

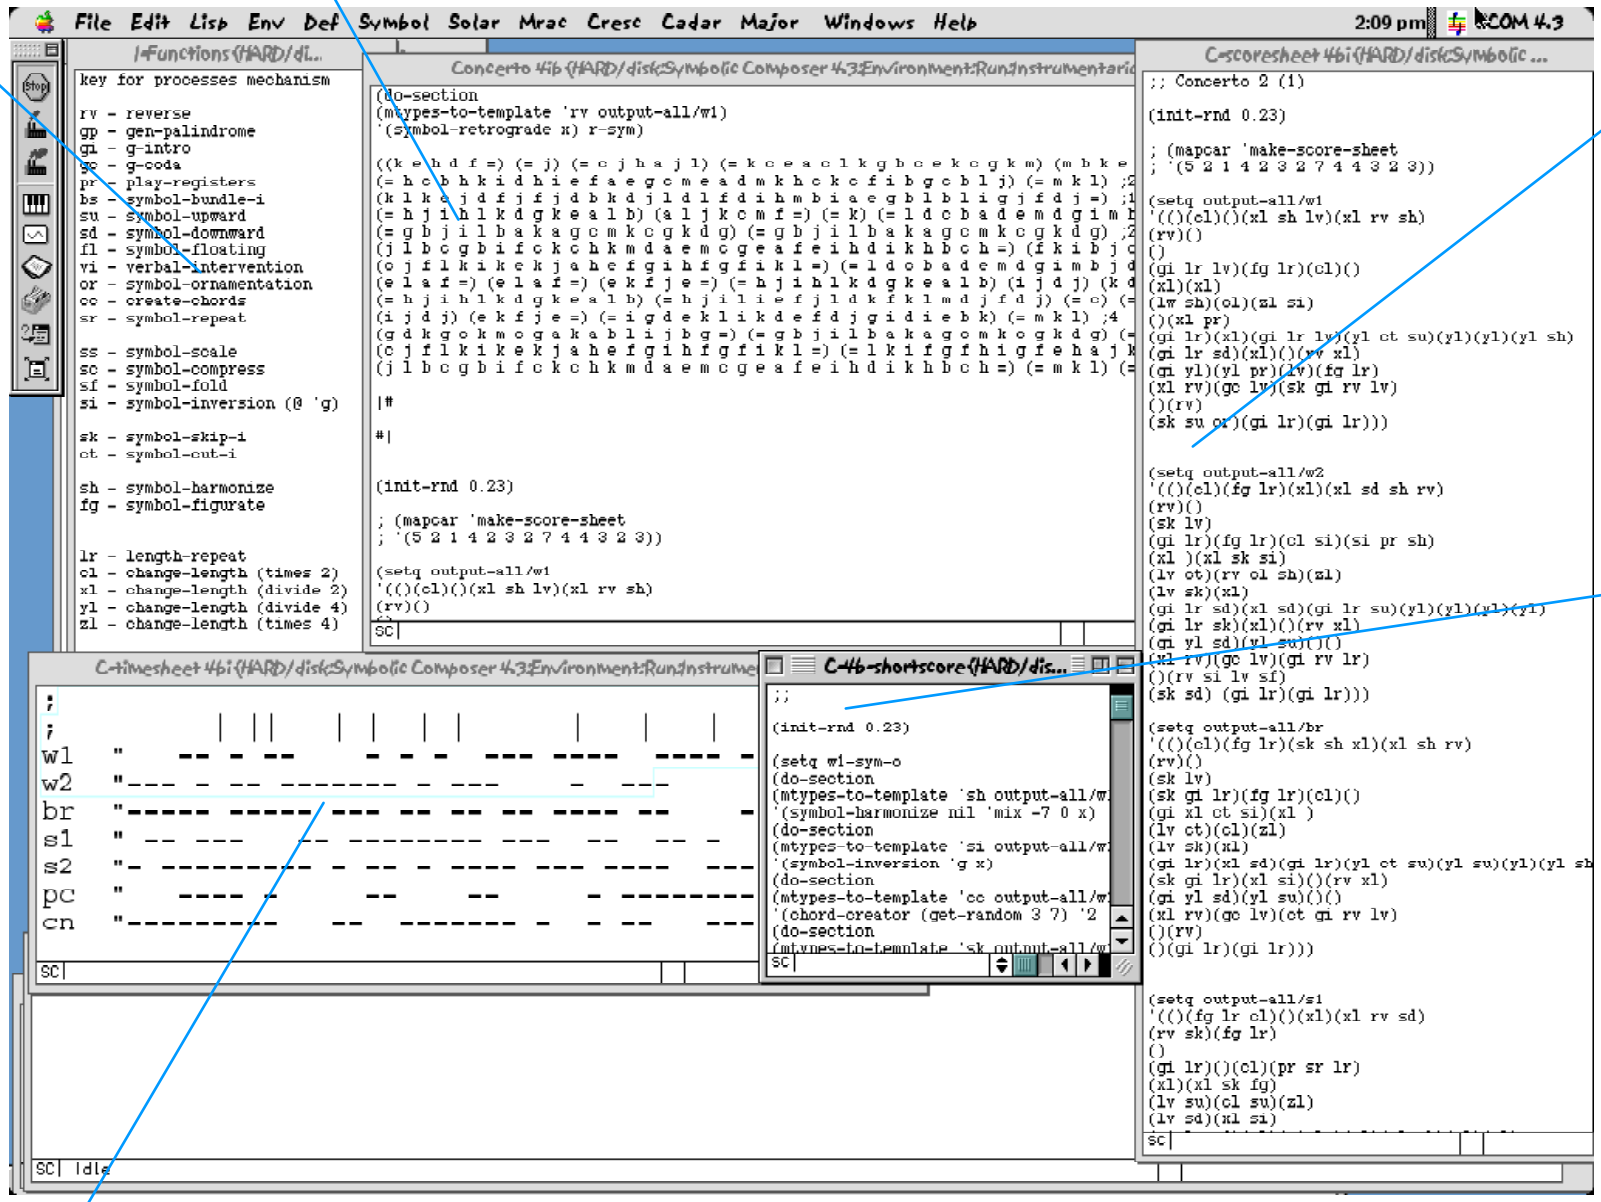
Here is the master list of symbol phrases which the Scoresheet commands process across the 7 orchestral layers

The I-Functions file contains all the processing functions needed to drive the Scoresheet. Most of the functions are adapted versions of standard SCOM tools with their parameters already set and defined

This is the Scoresheet displaying the complete processing lists of I-Functions for wind1 & 2, brass and Strings 1 parts

Here is the Process-list window which brings together the Scoresheet commands with the I-Functions. At the end of this file you'll find the standard scoring definitions: def- tonality, def-symbol etc

The timesheet is generated from the <build-array> function. Each beat/space column is equivalent to a symbol phrase in the master list. Note that the resolution of each beat space matches the length of the phrase itself (see the full code on page 17)



```

These expressions output the basic note-length data for each instrumental part

The <symbol-swallow> function is the key to the whole process which allows instrumental pitches (symbols) and rhythms (note-lengths) to synchronize when scored on a timesheet

The following section of code is arranged in 2 columns to make it easier

```

```

This is the Coda of Movement 1. It is organised quite differently from any other movement in the Concerto sequence. It takes the zone structure of the last twelve phrases of the first section and repeats it. Symbol-phrases are generated as before BUT these are set against a string of tonalities generated (using <g-chord>) from the final chord of section 1. This technique first appears in the second movement of my Conversations in Colour (2001)
